

ABSTRACT

[Object] To provide a portable folding bicycle which allows the user to carry the bicycle with ease in a train, bus, or the like, without any trouble.

[Solving Means] A handle support 1 and a wheel support frame 2 are engaged with each other through a folding mechanism 3 which allows the user to turn the handle support 1 and the wheel support frame 2 around the turning axis extending along the lateral direction. Furthermore, the wheel support frame 2 includes a connection mechanism 4 which can be turned on a turning axis extending the longitudinal direction, thereby allowing connection of a rear wheel to the wheel support frame 2 while allowing switching between the turnable state, which allows the user to turn the rear wheel with the wheel support frame 2 as a turning axis, and the fixed state.
